# Problem Set 1

Lecturer: Steven Heilman Kyle Barron

## Exercise 1

Using the De Moivre-Laplace Theorem, estimate the probability that 1,000,000 coin flips of fair coins will result in more than 501,000 heads. (Some of the following integrals may be relevant:  $\int_{-\infty}^{0} e^{-t^2/2} dt / \sqrt{2\pi} = 1/2, \int_{-\infty}^{1} e^{-t^2/2} dt / \sqrt{2\pi} \approx .8413, \int_{-\infty}^{2} e^{-t^2/2} dt / \sqrt{2\pi} \approx .9772, \int_{-\infty}^{3} e^{-t^2/2} dt / \sqrt{2\pi} \approx .9987.$ 

**Solution:** Since coin flips of fair coins are independent Bernoulli random variables, we can use the De Moivre-Laplace Theorem. Let n = 1,000,000.

$$\begin{split} \mathbb{P}(X_1 + \ldots + X_n > 501000) &= 1 - \mathbb{P}(X_1 + \ldots + X_n \le 501000) \\ &= 1 - \mathbb{P}(X_1 + \ldots + X_n - 500000 \le 1000) \\ &= 1 - \mathbb{P}\left(\frac{X_1 + \ldots + X_n - 500000}{1000} \le 1\right) \\ &= 1 - \mathbb{P}\left(\frac{X_1 + \ldots + X_n - 500000}{1000 \cdot \sqrt{1/4}} \le 2\right) \\ &= 1 - \mathbb{P}\left(\frac{X_1 + \ldots + X_n - (1/2)n}{\sqrt{n} \cdot \sqrt{1/4}} \le 2\right) \\ &\approx 1 - \int_{-\infty}^2 e^{-t^2/2} \frac{dt}{\sqrt{2\pi}} \\ &= 1 - .9772 = .0228. \end{split}$$

(Where the approximation is given by the De Moivre-Laplace Theorem, and a=2.)

## Exercise 2

Let X and Y be nonnegative random variables. Recall that we can define

$$\mathbb{E}[X] := \int_0^\infty \mathbb{P}(X > t) dt.$$

Assume that  $X \leq Y$ . Conclude that  $\mathbb{E}[X] \leq \mathbb{E}[Y]$ .

More generally, if X satisfies  $\mathbb{E}[|X|] < \infty$ , we define  $\mathbb{E}[X] := \mathbb{E}[\max(X,0)] - \mathbb{E}[\max(-X,0)]$ . If X, Y, are any random variables with  $X \le Y$ ,  $\mathbb{E}[|X|] < \infty$  and  $\mathbb{E}[|Y|] < \infty$ , show that  $\mathbb{E}[X] \le \mathbb{E}[Y]$ .

**Solution:** Suppose that  $X \leq Y$ . We want to show that  $\mathbb{E}[X] \leq \mathbb{E}[Y]$ . Well by the definition of  $\mathbb{E}[X]$  above,

Problem Set 1 1-2

we can write

$$\mathbb{E}[X] \leq \mathbb{E}[Y] \Leftarrow \int_0^\infty \mathbb{P}(X > t) dt \leq \int_0^\infty \mathbb{P}(Y > t) dt$$

$$\Leftarrow \mathbb{P}(X > t) \leq \mathbb{P}(Y > t), \forall t$$

$$\Leftarrow \{X > t\} \subseteq \{Y > t\}, \forall t$$

$$\Leftarrow \text{ if } X > t, Y \geq X > t, \forall t$$

$$\Leftarrow X < Y.$$

That is, since  $X \leq Y$ , then if X > t, then  $Y \geq X > t$ . That means that the set of all X that is greater than t is contained within the set of all Y that is greater than t. Hence  $\mathbb{P}(X > t) \leq \mathbb{P}(Y > t), \forall t$ . Thus  $\mathbb{E}[X] \leq \mathbb{E}[Y]$ .

#### Exercise 3

Using the definition of convergence, show that the sequence of numbers

$$1, 1/2, 1/3, 1/4, \dots$$

converges to 0.

**Proof:** Let  $x_n = \frac{1}{n}$ , let  $\epsilon > 0$ , and let  $M = \frac{1}{\epsilon}$ . Then for n > M we have

$$|x_n - x| = \left| \frac{1}{n} - 0 \right| = \frac{1}{n} < \frac{1}{M} = \epsilon.$$

Therefore the sequence  $(x_n)$  with  $x_n = \frac{1}{n}$  converges to 0.

#### Exercise 4

Let  $x_1, x_2, ...$  be a sequence of real numbers. Let  $x, y \in \mathbb{R}$ . Assume that  $x_1, x_2, ...$  converges to x. Assume also that  $x_1, x_2, ...$  converges to y. Prove that x = y. That is, a sequence of real numbers cannot converge to two different real numbers.

**Proof:** Call  $(x_n)$  the sequence of  $x_1, x_2, ...$  Let  $x, y \in \mathbb{R}$ . Suppose that  $x_n \to x$  and  $x_n \to y$ . Suppose for contradiction that  $x \neq y$ .

Let  $\epsilon = \frac{|x-y|}{3}$ . Since  $x_n \to x$ , there exists  $M_x$  such that  $n > M_x \Rightarrow |x_n - x| < \epsilon$ . Since  $x_n \to y$ , there exists  $M_y$  such that  $n > M_y \Rightarrow |x_n - y| < \epsilon$ . Let  $Z = \max\{M_x, M_y\}$ . Then when n > Z,

$$|x-y| = |x-x_n + x_n - y| \le |x_n - x| + |x_n - y| < \frac{|x-y|}{3} + \frac{|x-y|}{3} < |x-y|,$$

where the second relation is from the triangle inequality and the third is using the convergence of  $x_n$  to x and y. This is a contradiction so x = y.

## Exercise 5

Let X be a uniformly distributed random variable on [-1,1]. Let  $Y := X^2$ . Find  $f_Y$ .

Problem Set 1

**Solution:** Let X be uniformly distributed on [-1,1], let  $g(x)=x^2$ , and let Y=g(X). Since X is continuous,  $x^2$  is continuous and  $F_Y$  is differentiable we can use Proposition 2.6 from the notes.

First note that

$$f_X(x) = \begin{cases} \frac{1}{2}, & x \in [-1, 1] \\ 0, & \text{otherwise.} \end{cases}$$

Then

$$f_Y(y) = \frac{d}{dy} \int_{\{x \in \mathbb{R}: g(x) \le y\}} f_X(x) dx$$
$$= \frac{d}{dy} \int_{\{x \in [-1,1]: x^2 \le y\}} \frac{1}{2} dx.$$

If y < 0, the integral is zero. If y > 1 the integral is 1. If  $y \in [0,1]$  we have

$$f_Y(y) = \frac{d}{dy} \frac{1}{2} \int_{-y^{1/2}}^{y^{1/2}} dx$$
$$= \frac{1}{2} \frac{d}{dy} [y^{1/2} + y^{1/2}]$$
$$= \frac{1}{2\sqrt{y}}.$$

So the PDF of Y is

$$f_Y = \begin{cases} 0, & y < 0 \\ \frac{1}{2\sqrt{y}}, & y \in [0, 1] \\ 0, & y > 1. \end{cases}$$

## Exercise 6

Let X be a uniformly distributed random variable on [0,1]. Let Y := 4X(1-X). Find  $f_Y$ .

**Solution:** We wish to find  $f_Y$ . We'll first find  $F_Y$  and then take the derivative. First note that when  $x \in [0,1]$ , the image of 4x(1-x) is [0,1]. So we only have to deal with y values between 0 and 1. Note that  $f_X(x) = 1$  on  $x \in [0,1]$ .

$$\begin{split} \mathbb{P}(Y \leq y) &= \mathbb{P}(4X(1-X) \leq y) \\ &= \mathbb{P}\left(0 \leq x \leq \frac{1-\sqrt{1-y}}{2}\right) + \mathbb{P}\left(\frac{1+\sqrt{1-y}}{2} \leq x \leq 1\right) \\ &= \frac{1-\sqrt{1-y}}{2} + 1 - \frac{1+\sqrt{1-y}}{2} \\ &= 1 - \sqrt{1-y} \text{ for } y \in [0,1]. \end{split}$$

Therefore, the PDF of Y is:

$$f_Y(y) = F_Y'(y) = \begin{cases} \frac{1}{\sqrt{1-y}}, & y \in [0,1] \\ 0, & \text{otherwise.} \end{cases}$$

Problem Set 1

## Exercise 7

Let X be a uniformly distributed random variable on [0,1]. Find the PDF of  $-\log(X)$ .

#### Solution:

Recall that the CDF of 
$$X$$
 is  $F_X(x) = \begin{cases} 0, & x \leq 0 \\ x, & x \in [0,1] \\ 1, & x \geq 1. \end{cases}$ 

Then to find the CDF of Y,

$$F_Y(y) = \mathbb{P}(Y \le y) = \mathbb{P}(-\log(X) \le y) = \mathbb{P}(X \ge e^{-y}) = 1 - \mathbb{P}(X \le e^{-y}) = 1 - e^{-y}.$$

Therefore 
$$F_Y(y) = \begin{cases} 0, & y < 0 \\ 1 - e^{-y}, & y \ge 0 \end{cases}$$
, so  $f_Y(y) = \begin{cases} 0, & y < 0 \\ e^{-y}, & y \ge 0 \end{cases}$ .

## Exercise 8

Let X be a standard normal random variable. Find the PDF of  $e^X$ .

**Solution:** Let X be standard normal. Let  $Y = e^X$ .

$$f_Y(y) = \frac{d}{dy} \int_{\{x \in \mathbb{R}: g(x) \le y\}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx$$

$$= \frac{d}{dy} \int_{\{x \in \mathbb{R}: e^x \le y\}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx$$

$$= \frac{d}{dy} \int_{\{x \in \mathbb{R}: x \le \ln(y)\}} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx$$

$$= \frac{d}{dy} \int_{\infty}^{\ln(y)} \frac{1}{\sqrt{2\pi}} e^{-\frac{x^2}{2}} dx$$

$$= \frac{1}{\sqrt{2\pi}} e^{-\frac{\ln(y)^2}{2}}$$

$$= \frac{1}{\sqrt{2\pi}} e^{\ln(y^{-1/2})^2}$$

$$= \frac{1}{\sqrt{2\pi}} \left( e^{\ln(y^{-1/2})} \right)^{\ln(y^{-1/2})}$$

$$= \frac{1}{\sqrt{2\pi}} \left( y^{-1/2} \right)^{\ln(y^{-1/2})}.$$

Note that  $f_Y(y)$  is defined this way on  $y \in \mathbb{R}$ .

#### Exercise 9

Let X, Y, Z be independent standard Gaussian random variables. Find the PDF of  $\max(X, Y, Z)$ .

Problem Set 1 1-5

**Solution:** Let X, Y, Z be independent standard Gaussian random variables. Denote  $W = \max\{X, Y, Z\}$ . First I'll find the CDF of W and then I'll take the derivative to get the PDF of W.

$$F_W(w) = \mathbb{P}(W \le w)$$

$$= \mathbb{P}(X \le w, Y \le w, Z \le w)$$

$$= \mathbb{P}(X \le w)\mathbb{P}(Y \le w)\mathbb{P}(Z \le w)$$

$$= F_X(w)F_Y(w)F_Z(w)$$

$$= F_X(w)^3.$$

$$f_W(w) = 3F_X(w)^2 \cdot f_X(w).$$

Where  $f_X(w) = \frac{1}{\sqrt{2\pi}} e^{-w^2/2}$  and  $F_X(w) = \int_{-\infty}^w \frac{1}{\sqrt{2\pi}} e^{-t^2/2} dt$ .

#### Exercise 10

Let X be a random variable uniformly distributed in [0,1] and let Y be a random variable uniformly distributed in [0,2]. Suppose X and Y are independent. Find the PDF of  $X/Y^2$ .

**Solution:** Let X be uniformly distributed on [0,1] and let Y be distributed uniformly on [0,2]. Let  $Z = \frac{X}{Y^2}$ . First I'll find the CDF of Z and then I'll find the PDF of Z. Since X and Y are both positive, the range for Z is  $[0,\infty)$ .

To find the CDF of Z we need to do

$$\mathbb{P}(Z \le z) = \mathbb{P}\left(\frac{X}{Y^2} \le z\right) = \int \int_{\{0 \le x \le 1, 0 \le y \le 2, \frac{x}{u^2} \le z\}} f_{X,Y}(x,y) dx dy = \int \int_{\{0 \le x \le 1, 0 \le y \le 2, \frac{x}{u^2} \le z\}} f_X(x) f_Y(y) dx dy$$

where the last equality is because X and Y are independent. The substituting in the two PDF's, the integral becomes  $\frac{1}{2} \int \int dx dy$ .

We now need to break this up into cases.

- Case 1:  $z \cdot y^2 \ge 1$ . Then  $y \ge \sqrt{\frac{1}{z}} \Rightarrow 0 \le X \le 1$ .
- Case 2:  $z \cdot y^2 < 1$ . Then  $y < \sqrt{\frac{1}{z}} \Rightarrow 0 \le x \le z \cdot y^2$ .

Those are the cases for z and y jointly but we also have the cases just depending on z:

• Case A: if  $\sqrt{\frac{1}{z}} \ge 2$ , only case 2 exists above.

$$F_Z(z) = \frac{1}{2} \left( \int_0^2 \int_0^{zy^2} dx dy \right)$$

$$= \frac{1}{2} \left( \int_0^2 z y^2 dy \right)$$

$$= \frac{1}{2} \left[ \frac{zy^3}{3} \right]_{y=0}^{y=2}$$

$$= \frac{4z}{3}, \text{ for } 0 \le z \le \frac{1}{4}.$$

Problem Set 1

• Case B: if  $\sqrt{\frac{1}{z}} < 2$ , both case 1 and 2 above exist.

$$F_Z(z) = \frac{1}{2} \left( \int_{\sqrt{\frac{1}{z}}}^2 \int_0^1 dx dy + \int_0^{\sqrt{\frac{1}{z}}} \int_0^{zy^2} dx dy \right)$$

$$= \frac{1}{2} \left( 2 - \sqrt{\frac{1}{z}} + \left[ \frac{zy^3}{3} \right]_{y=0}^{y=\sqrt{\frac{1}{z}}} \right)$$

$$= \frac{1}{2} \left( 2 - \sqrt{\frac{1}{z}} + \frac{z \cdot z^{-3/2}}{3} \right)$$

$$= \frac{1}{2} \left( 2 - \sqrt{\frac{1}{z}} + \frac{z^{-1/2}}{3} \right)$$

$$= \frac{3\sqrt{z} - 1}{3\sqrt{z}}, \text{ for } z > \frac{1}{4}.$$

So therefore, taking the derivative of each we get

$$f_Z(z) = \begin{cases} \frac{1}{6z^{3/2}}, & z > \frac{1}{4} \\ \frac{4}{3}, & 0 \le z \le \frac{1}{4}. \end{cases}$$
